Education

University of Maryland, Baltimore County

B.S. in Computer Science, GPA: 3.1

Baltimore, MD

Aug. 2022 – Dec. 2026

Experience

The Walt Disney Company

Software Engineering Intern, Studio Technology (AI Platform)

Burbank, CA

June 2026 – Aug. 2026

TypeScript · Next.js (App Router, server components) · PostgreSQL · GitLab CI — stack learned on the job

- Owned the member-facing model catalog for an internal AI platform used by teams across the studio: browse, detail, and comparison views resolving through a single server-side loader, so three views of the same model can never disagree about it.
- Closed a data exposure where permission-scoped access fields and admin metadata reached catalog responses served to unprivileged users — stripped at the serialization boundary, enforced at three independent points, with tests asserting the serialized JSON contains none of them.
- Unblocked seven approved merge requests that could not reach production after their base branch closed: replayed ten tickets of catalog and dashboard work onto main as one branch, resolving each conflict against a category taxonomy upstream had changed twice mid-flight.
- Designed a model access-request service end to end — schema with full audit history, user and admin REST APIs, permission-gated review queue — where approval records intent and a human still performs the grant, keeping model-spend permissions outside the application's blast radius. Built on a branch that closed unadopted.
- Learned TypeScript and Next.js on the job, shipping across 15 reviewed merge requests.

Financial Industry Regulatory Authority (FINRA)

Software Engineer Intern

Rockville, MD

June 2025 – Aug. 2025

Python · Selenium/Playwright · Power BI · LLM APIs

- Built synthetic monitoring for a company-wide Teams chatbot that exposed no vendor health endpoint: automation drove the real user path and alerted the team channel on failure. Ran unattended for four weeks and caught a Saturday outage.
- Categorized ~500 helpdesk tickets in Python and found the top recurring issues were knowledge-availability failures — the answer already existed and users could not find it — which redirected what the chatbot ingested; shipped the analysis as a Power BI dashboard.
- Defined what “business impact” meant for an LLM contract-review agent — prior terms vs. new terms vs. downstream policy effect — and built the model-calling component; team won 1st place at an internal 48-hour hackathon.

American University

Software Engineer Intern

Washington, DC

Jan. 2024 – Sep. 2024

Java · Spring Boot · PostgreSQL

- Owned the API contract between a housing-market model built by researchers and a frontend built by another team — Spring Boot and PostgreSQL exposing health, inference, and ingest endpoints — and instrumented the usage logging that measured 40–50 daily users.

Projects

Job Application Engine | *Python, Next.js, SQLite, GitHub Actions*

- Built resume tailoring that can only assert facts from an approved fact base: five deterministic checks, plus an adversarial suite that plants fabricated bullets and fails the build if the checks miss even one.
- Built the ingestion pipeline over three job-board APIs (Greenhouse, Ashby, Lever): ranked 600+ postings across 49 boards, recorded the matching phrase behind every flagged requirement, and de-duped on a company/title/location/requisition hash. 76 tests, GitHub Actions CI.

Campus Delivery Platform | *Go, Gin, PostgreSQL/Supabase, Stripe, React Native — team of 4*

Fall 2025

- Led a 4-person team and built the Go backend: 17 token-authenticated routes, a seven-state order lifecycle with per-state timestamps, and courier actions guarded on both order state and caller ownership inside the update statement, so a courier cannot complete another's order.
- Kept payment authority on the server: the backend computes the fee split and creates the Stripe PaymentIntent, the client receives only a client secret, and an order reaches confirmed only from a signature-verified webhook, never from the client.

Technical Skills

Languages: Python, TypeScript, Go, Java, SQL, JavaScript

Backend & Data: Spring Boot, Gin, Next.js, PostgreSQL, Supabase, REST APIs, SQL migrations, Stripe

Frontend: React, React Native (Expo), Tailwind

Testing & CI: pytest, Playwright, Selenium, Node test runner, GitHub Actions, GitLab CI, OpenAPI contract checks

Tools: Git, GitLab merge requests, Jira, Figma, Power BI, LLM API integration
