Education

University of Maryland, Baltimore County

B.S. in Computer Science, GPA: 3.1

Baltimore, MD

Aug. 2022 – Dec. 2026

- Relevant coursework: Data Structures and Algorithms, Database Management Systems, Operating Systems, Computer Networks.

Experience

The Walt Disney Company

Software Engineering Intern, Studio Technology (AI Platform)

Burbank, CA

June 2026 – Aug. 2026

TypeScript · Next.js · PostgreSQL (raw SQL, versioned migrations) · GitLab CI · AI coding assistants daily

- Owned the member-facing model catalog for an internal AI platform used by teams across the studio: browse, detail, and comparison views resolving through a single server-side loader, so three views of the same model can never disagree about it.
- Designed a model access-request service end to end — PostgreSQL schema with composite keys, versioned migrations, and an audit-event table holding full request history; user and admin REST APIs; a permission-gated review queue — where approval records intent and a human still performs the grant, keeping model-spend permissions outside the application's blast radius. Branch closed unadopted.
- Closed a data exposure where permission-scoped access fields and admin metadata reached catalog responses served to unprivileged users — stripped at the serialization boundary, enforced at three independent points, with tests asserting the serialized JSON contains none of them.
- Unblocked seven approved merge requests stranded by a closed base branch, replaying ten tickets onto main as one branch against a taxonomy upstream had changed twice mid-flight; shipped 15 reviewed merge requests in TypeScript and Next.js, both learned on the job.

Financial Industry Regulatory Authority (FINRA)

Software Engineer Intern

Rockville, MD

June 2025 – Aug. 2025

Python · Selenium/Playwright · Power BI · LLM APIs

- Built synthetic monitoring for a company-wide Teams chatbot that exposed no vendor health endpoint: automation drove the real user path and alerted the team channel on failure. Ran unattended for four weeks and caught a Saturday outage.
- Categorized ~500 helpdesk tickets in Python and found the top recurring issues were knowledge-availability failures — the answer already existed and users could not find it — which redirected what the chatbot ingested; shipped the analysis as a Power BI dashboard.
- Defined what “business impact” meant for an LLM contract-review agent — prior terms vs. new terms vs. downstream policy effect — and built the model-calling component; team won 1st place at an internal 48-hour hackathon.

American University

Software Engineer Intern

Washington, DC

Jan. 2024 – Sep. 2024

Java · Spring Boot · PostgreSQL

- Owned the API contract between a housing-market model built by researchers and a frontend built by another team — Spring Boot and PostgreSQL exposing health, inference, and ingest endpoints — and instrumented the usage logging that measured 40–50 daily users.

Projects

Inventory Management System | *Python, FastAPI, PostgreSQL, MongoDB, Supabase — sole developer, in use by client* 2025

- Migrated a retail client's live inventory system from MongoDB to PostgreSQL and designed the four-table schema it runs on today: stock and pricing invariants enforced in the database through CHECK constraints, restricted foreign keys, and DECIMAL money columns, plus version-column optimistic locking so two concurrent edits cannot silently overwrite each other.
- Made the data layer auditable and searchable: triggers write every insert, update, and delete to an audit table with JSONB before/after values, row-level security gates all four tables, and GIN/trigram indexes back fuzzy product search alongside B-tree indexes on the reporting paths. Tests cover concurrency, conflict resolution, migration, and auth.

Campus Delivery Platform | *Go, Gin, PostgreSQL/Supabase, Stripe, React Native — team of 4* Fall 2025

- Led a 4-person team and built the Go backend: 20 REST routes with 14 behind token auth, a seven-state order lifecycle over Postgres with timestamped transitions, and courier actions scoped by caller ownership inside the UPDATE statement's WHERE clause, so a courier cannot complete an order assigned to someone else.
- Kept payment authority on the server: the backend computes the three-way fee split and creates the Stripe PaymentIntent, the client receives only a client secret, and an order advances only from a signature-verified webhook, never from the client.

Technical Skills

Languages: Java, Python, Go, TypeScript, SQL, JavaScript

Databases: PostgreSQL, MongoDB, SQLite, Supabase; schema design, versioned migrations, B-tree and GIN/trigram indexing, CHECK constraints, foreign keys, triggers, row-level security, optimistic locking, audit tables, JSONB

Backend & APIs: REST API design, FastAPI, Spring Boot, Gin, Next.js, OpenAPI contract checks, JWT/token auth, Stripe webhooks

Testing, CI/CD & Tools: pytest, Playwright, Selenium, GitHub Actions, GitLab CI, synthetic monitoring, code review, Git, Agile (Jira), Power BI
